

AA PROJECTS

PFI - CHESHIRE SCHOOLS

LEAD SAMPLING & ABATEMENT

We were appointed by AA Projects to undertake Lead Sampling and Controlled Abatement works across various Cheshire Schools as part of a wider PFI initiative.

Works included the systematic sampling of doors, windows and external façades in order to identify the presence and concentration of lead contained within the various paint finishes. Following the identification of lead contaminants, iES produced a detailed abatement specification in line with the wider refurbishment scope.

Finally utilising our expertly trained staff, we completed the controlled removal of all lead paint coatings, forming enclosure systems and containment zones to all internal doorways and window bays to prevent the spread of debris and cross contamination. On completion of removal works to each section, environmental cleaning works were undertaken to remove all traces of paint coatings, dust and general debris prior to demobilising the sectional enclosures and containment zones ready for reinstatement works.

All works were completed within budget and on programme to the satisfaction of the client and the individual educational establishments.

VALUE: £48,000
